

This method shows inherited weak points and possible malignancies long before clinical findings. According to Josef Deck, a German clinician and researcher and others, each organ has a specific site in the iris. For instance morphological changes in the iris in the site of the pancreas indicate an underlying pancreatic cause in the case of high blood pressure. This can lead to tailored therapeutic actions. Josef Deck had close contact to the academic world in Moscow and was rewarded at the Academy of Science in Moscow for his research on Iridology
