

# Indumed Magnetic Field Therapy

Indumed Magnetic Field Therapy is a new development based on the simulations of the naturally occurring electromagnetic waves which exist between the earth's surface and the ionosphere. This unit generates an electromagnetic pulse of very low strength which is similar in nature and intensity to the magnetic field of the earth.

This low field strength is an almost natural field which is much more in harmony with the body's own energies than are some other magnetic therapies of greater strength.

Research shows that magnetic field therapy of this nature has a positive effect on the integrity of the cell-membrane as well as improving the cellular communication via the nerve synapses.
