PHYSOSTIGMA VENENOSUM

Kalabar, Gottesurteilbohne

IDEA: Paralysis, tremores, convulsions and jerks most notably in the back/spine.

Dysbalance between Vagus and Sympathikus nerves. Patient cannot stop thinking.

Acetylcholine is the Neurotransmitter in the entire presynaptic Central Nervous System. That is both the parasympathetic and the sympathetic part. Further it remains the transmitter in the postsynaptic parasympathetic part and triggers also the motor action of skeletal muscles. If built down of Acetylcholine is blocked by Physostigma, the entire modulation of Neurotransmitters is shifting to the Nervus Vagus. Balance between Vagus and Sympathicus would be deeply disturbed. The result will be over-stimulation of the Vagus causing paralysis, tremor, Miosis, intestinal colics with nausea, and stimulation of glands and sweat. Chorea minor and M. Parkinson may show.

Calabar bean contains physostigmine, a reversible cholinesterase* inhibitor alkaloid. The alkaloid physostigmine acts in effect like nerve gas, disrupting communication between the nerves and muscles, and resulting in copious salivation, seizures, loss of control over the bladder and bowels, and eventually loss of control over the respiratory system, causing death by asphyxiation.

*Cholinesterase inactivates Acetylcholine into Choline and acetic acid. Thus the prior excited nerve will be at rest again. Acetylcholine, the first neurotransmitter discovered, was originally described as "vagus stuff" by Otto Loewi because of its ability to mimic the electrical stimulation of the vagus nerve. It is now known to be a neurotransmitter at all autonomic ganglia, at many autonomically innervated organs, at the neuromuscular junction, and at many synapses in the CNS

The main antidote to Calabar bean poisoning is atropine, which may often succeed; and the other measures are those usually employed to stimulate the circulation and respiration. Unfortunately, the antagonism between physostigmine and atropine is not perfect, and Sir Thomas Richard Fraser has shown that in such cases there comes a time when, if the action of the two drugs is summated, death results sooner than from either alone. Thus atropine will save life if three and a half times the fatal dose of physostigmine has been taken, but will hasten the end if four or more times the fatal dose has been ingested.

They constitute the E-ser-e or ordeal beans of the people of Old Calabar, being administered to persons accused of witchcraft or other crimes. In cases where the poisonous material did its deadly work, it was held at once to indicate and rightly to punish guilt; but when it was rejected by the stomach of the accused, innocence was held to be satisfactorily established.

Physostigmine is also used as antidote for Chondodendron tomentosum born **Curares**. However, Neostigmine is preferred because of own muscle stimulating effects.

Physostigmine salts are used in ophthalmology for glaucoma, constipation due to intestinal weakness, Tetanus, locomotoric ataxia, writer's cramp, paraplegia (total paralysis of lower and upper extremities) due to myelitis, chorea, epilepsy, **Strychnine poisoning** and **progressive paralysis**. SCIRRHINUM

IDEA: Cancer nosode from Scirrhus Ca

Scirrhinum is a homeopathic sub-remedy of Carcininum, used for treating cancer, enlarged glands, hemorrhages, varicose veins and worms.
Breast, cancer. M. Hodgkin etc.

Cancer diathesis: “There is no cancer case where Carcininum is not of advantage sooner or later,” R.M. Cooper

Scirrhinum is typically given in 200c dosage that is "plussed," which means shaken and dissolved in water, alcohol or another liquid. Potency, or the strength of the dosage, is determined by how much it was diluted and plussed.

Plussing Method

The Plussing Method consists of diluting three pellets or globules of the remedy in eleven teaspoons of spring water. The patient sips one teaspoon every fifteen minutes. Between each dose, the water is gently stirred or, if in a bottle, shaken once. The patient takes ten teaspoonfuls over the course of approximately two and a half hours and reserves the last teaspoon for the next day.

The next day ten teaspoons of fresh water are added to the original mixture (but not any fresh medicine) and the process is repeated. The procedure continues for seven days – after which the remedy is changed and the same procedure is repeated with the new medicine. In weeks 3 and 4 (and every subsequent week), the patient starts with a mixture of fresh water and fresh medicine.

HISTORY - Burnett is the authority for this nosode. He proved it on himself and produced “a tremendous sinking at the navel,” which he regarded as a keynote for its use. Scirr. has aided the cure of many cases of breast tumor in Burnett’s hands.

With Scirrhinum, Burnett cured a man of hard glands which appeared on the left side of the neck after other glands had been removed by the patient’s brother, a surgeon. Hemorrhages and varicose veins of legs and feet with purple points, have also been cured by Burnett with Scirr.

COMMENTS - A patient to whom Burnett had given Scirr. mentioned to him that it had caused the passage of an enormous number of thread worms. On this hint Burnett gave it with great success in many cases of this troublesome complaint. In inveterate cases where Cina and Teucr. have given little relief, Scirr. has wrought a great change for the better.

Try for Morgellons.

Morgellons-filaments grow out of the skin (below)

Modalities - The time of aggravation of Scir. is from 5 to 6 p.m. and irregularly on through the night.

SECALE CORNUTUM

Ergot

IDEE: Spasms of vessels mit Zuckungen der Extremitäten

Ergot is found growing on rye (see picture below) wheat barley and other specific types of grasses. In fact, ergot of rye substitutes the grain of rye with deep, purplish sclerotium - a plant ailment caused by the fungus called *Claviceps purpurea*. In other words, a sclerotium (ergot) is basically considered a fungus and when it is present in plants they ought not to be consumed in large amounts since it is toxic for humans as well as livestock. When *secale cornutum* is found in any crop, it becomes infected and when any person is infected with the toxin of this fungus, it is known as ergotism. It is interesting to note that the fungus *Claviceps purpurea* was the unusual source from which LSD was isolated for the first time.

Poisoning caused by the ergot of rye is denoted as ergotism and it can be distinguished by two types of symptoms. Convulsive ergotism wherein malfunctioning of the nervous system causing the patient to endure spraining and distorting in pain, together with shuddering, trembling and a twisted neck. The other type known as gangrenous ergotism, a condition where the victim may drop parts of their extremities, for instance lose fingers, toes and even ear lobes owing to constriction of blood vessels passing through these extremities. Victims who endure such constriction of the blood vessels also experience a scorching pain - something common among the farm animals that are left to graze in open fields.
