Summary

Light travels in little energy packages (**photons**) of various color and wavelength as shown by a prism. Photons are the universal **carrier of energy**. They are required for any build-up. They activate the electron which then jump starts chemical reaction as shown in photosynthesis.

Alexander Gurwitsch discovered bio-photons in living species which are the overall controller of cellular function (Popp). They are needed for any build-up, repair and cure. In chronic disease, ailing tissues need additional photons in order to **activate electrons** to neutralize the **free radical** surplus. This is a specific process, for each tissue and organ has a different vibrational field and consequently would resonate differently.

Resonating external fields will **couple** with ailing organ fields, speed up hydrogen spin and thereby express specific bio-photons. These again will activate the **protein electrons** and thereby jump-start chemistry. Thus resonating fields can be called antioxidants.

The external fields must be harmonious (Schroedinger), minute (Prigogine), of low frequency and intensity (Adey), and **fractal** to the ailing field (Mandelbrot).

External resonating field therapy is a very powerful healing tool as proven with dramatic success in severe osteoporosis. By means of **tunneling** it penetrates barriers and works deep into the tissue. It is also an option for any other chronic condition.
