

Hi Dr.Kessler,

I have a potential client for Ondamed who is suffering from depression. Besides the MC-MF protocol, are there any specific programs I should look for to treat depression? What is the main complaint in this case?

Thank you so much for your valuable help!

Karsten Mangels

Dear Karsten,

you would detect all foci from top to toe with the specific frequencies. Then you start treating the top focus and check whether it would normalize the next lower focus. If not, you would treat the next lower focus and would check whether it would normalize the top focus. If not you start treating the next lower focus and check whether it normalizes the top focus. If so, it also must normalize all other foci. That way you will find the main focus.

Mental disorders do not have a main complaint point. If there is no

MC(main complaint) you would follow the procedure described above

This will give you a first glimpse and understanding about the structure of the problem. Combining that finding with microorganism related

frequencies and pre-set programs will further support the understanding of the structure of the depression.

Of course the specific frequencies to begin with have also contributed to the understanding. Thus you build up a protocol to treat the depression.

The findings will have to be discussed and debated of course.

Sincerely

Dr.Kessler
